October 2002
AHRQ Pub. No. 02-R208
Version 3 (February 20, 2006)

Abstract

The value of information on health care quality has never been so widely recognized; yet many organizations lack the resources and/or expertise to build a quality information program from the ground up. Recognizing this, the AHRQ Quality Indicators were developed specifically to meet the short-term needs for information on health care quality using standardized, user-friendly methods and existing sources of data.

This module of the AHRQ Quality Indicators was designed to capitalize on the availability of administrative data on inpatient stays to produce information for Inpatient Quality Indicators (IQIs). These measures include:

- **volume** of certain intensive, high-technology, or highly complex procedures for which evidence suggests that institutions performing more of these procedures may have better outcomes;
- **mortality** for inpatient procedures and for inpatient conditions; and
- **utilization** indicators which examine procedures whose use varies significantly across hospitals and for which questions have been raised about overuse, underuse, or misuse.

This document is the software documentation for the Inpatient Quality Indicators software Version 3.0, which is provided on the AHRQ Web site. The software was developed in SPSS, for use on a personal computer. AHRQ's goal, by making this tool publicly available, is to assist users in producing information on health care quality more cost effectively.

Details on the development of the Inpatient Quality Indicators can be found in "Guide to Inpatient Quality Indicators: Quality of Care in Hospitals - Volume, Mortality, and Utilization."

Acknowledgments

Support efforts, including refinement and enhancement of the AHRQ Quality Indicators and related products, are provided by the Support for Quality Indicators (SQI-II) contract team.

The following individuals from **Battelle Memorial Institute, Stanford University, and University of California (UC)** constitute the Support for Quality Indicators core team:

Sheryl M. Davies, M.A.	Mark Gritz, Ph.D.	Kathryn M. McDonald, M.M.
Bruce Ellis, M.S.	Greg Hubert, B.S.	Patrick Romano, M.D., M.P.H.
Jeffrey Geppert, J.D.	Elaine Keller, M.Ed.	Jeff Schoenborn, B.S.

The **Agency for Healthcare Research and Quality** Support for Quality Indicators team includes:

Marybeth Farquhar, Project Officer	Mary B. Haines, Contract Officer
Mamatha Pancholi, Project Officer	

The following staff from the **Evidence-based Practice Center (EPC) at UCSF-Stanford** performed the evidence review, completed the empirical evaluation, and created the programming code and technical documentation for the AHRQ Inpatient Quality Indicators:

AHRQ Quality Indicators, Software Documentation, Version 3.0: Inpatient Quality Indicators

1.0 Introduction

This documentation describes the software for implementing the Inpatient Quality Indicator (IQI) module of the AHRQ Quality Indicators Version 3.0, and highlights features of the analytic approach of particular interest to new users. Detailed information about the Inpatient Quality Indicators (IQI) is contained in the companion document *Guide to Inpatient Quality Indicators*, which includes information about the development of the indicators and their definitions. Detailed definitions, including all ICD-9-CM codes included in or excluded from the numerator and denominator for each indicator, are contained in a separate document *Inpatient Quality Indicators Technical Specifications*. See [Appendix A](#) for links to these and other documents as well as Web sites that may be of interest to IQI users.

The section called “Interpreting the Results” has been removed from this document. *The Guide to the Inpatient Quality Indicators* contains a new section, “Using Different Types of QI Rates.”

The software consists of a series of computer programs that:

- Assign and calculate IQIs from hospital discharge abstracts or UB (uniform billing) claims data.
- Print IQI results in SPSS format that can be imported into word processing documents, spreadsheets, or graphics software, at the user's option.
- Provide four options for stratifying rates by geographic areas.
- Create risk-adjusted rates that adjust for casemix differences and expected rates that adjust for performance differences.
- Create smoothed rates that reduce fluctuations over time due to random variation.

This documentation includes:

- A discussion of the data elements necessary to produce the AHRQ IQIs and the uniform coding conventions recommended for those elements.
- Descriptions of the IQI processing steps in nontechnical language.
- Detailed descriptions of the functions of each IQI SPSS program.

Critical user information is highlighted with this symbol: 

2.0 Components of the Inpatient Quality Indicators Module

As shown in Table 3 on page 6, the Inpatient Quality Indicators module consists of five SPSS programs and four ASCII text files that contain auxiliary data. These programs and text files are described in the subsequent sections of this document. The programs were developed for use in Statistical Package for the Social Sciences (SPSS¹), version 7 or higher, on a Windows personal computer.

A note on the naming conventions for the Inpatient Quality Indicators (IQI) module programs. Most programs have names of the form IQSPSi, IQSPSAi, or IQSPSPi. The first two characters "IQ" of the program name indicates an Inpatient Quality Indicators program, to distinguish it from other modules that have been or will be released from AHRQ. The next three characters of the program name are "SPS" and are present to distinguish the program from the SAS versions of the software. In the programs that are specific to either Area or Provider indicators, the sixth character of the program name is either "A" or "P". The sixth character is an "A" if it is a program for the production of Area indicator rates that use county and/or Office of Management and Budget (OMB) defined metropolitan or micropolitan area (Metro Area) area populations as denominators. The sixth character is a "P" if it is a program for the production of Provider indicator rates that use subsets of the hospital discharge population. The last character (i) of the variable name designates the number of the specific program.

3.0 Quick Reference

The subsequent four pages are intended to serve as a quick reference to assist in reading this documentation and in reviewing the Inpatient Quality Indicator (IQI) module outputs. Processing steps are shown first (Figures 1 and 2) followed by a listing of the module variables (Table 1), variable prefixes (Table 2) and module contents (Table 3). One suggestion is to print these pages in duplex mode on two sheets of paper so that they can then be easily referred to as the need arises.

3.1 Processing Steps

Figure 1 shows processing steps for the Inpatient Quality Provider Indicators, while Figure 2 shows steps for the Inpatient Quality Area Indicators.

¹ SPSS is a statistical program distributed by SPSS, Inc. (<http://www.spss.com>). The company may be contacted directly regarding the licensing of their product. SPSS, Inc. does not have any affiliation with AHRQ nor involvement in the development of the AHRQ QIs.

Figure 1. Processing Steps for the Inpatient Quality Provider Indicators

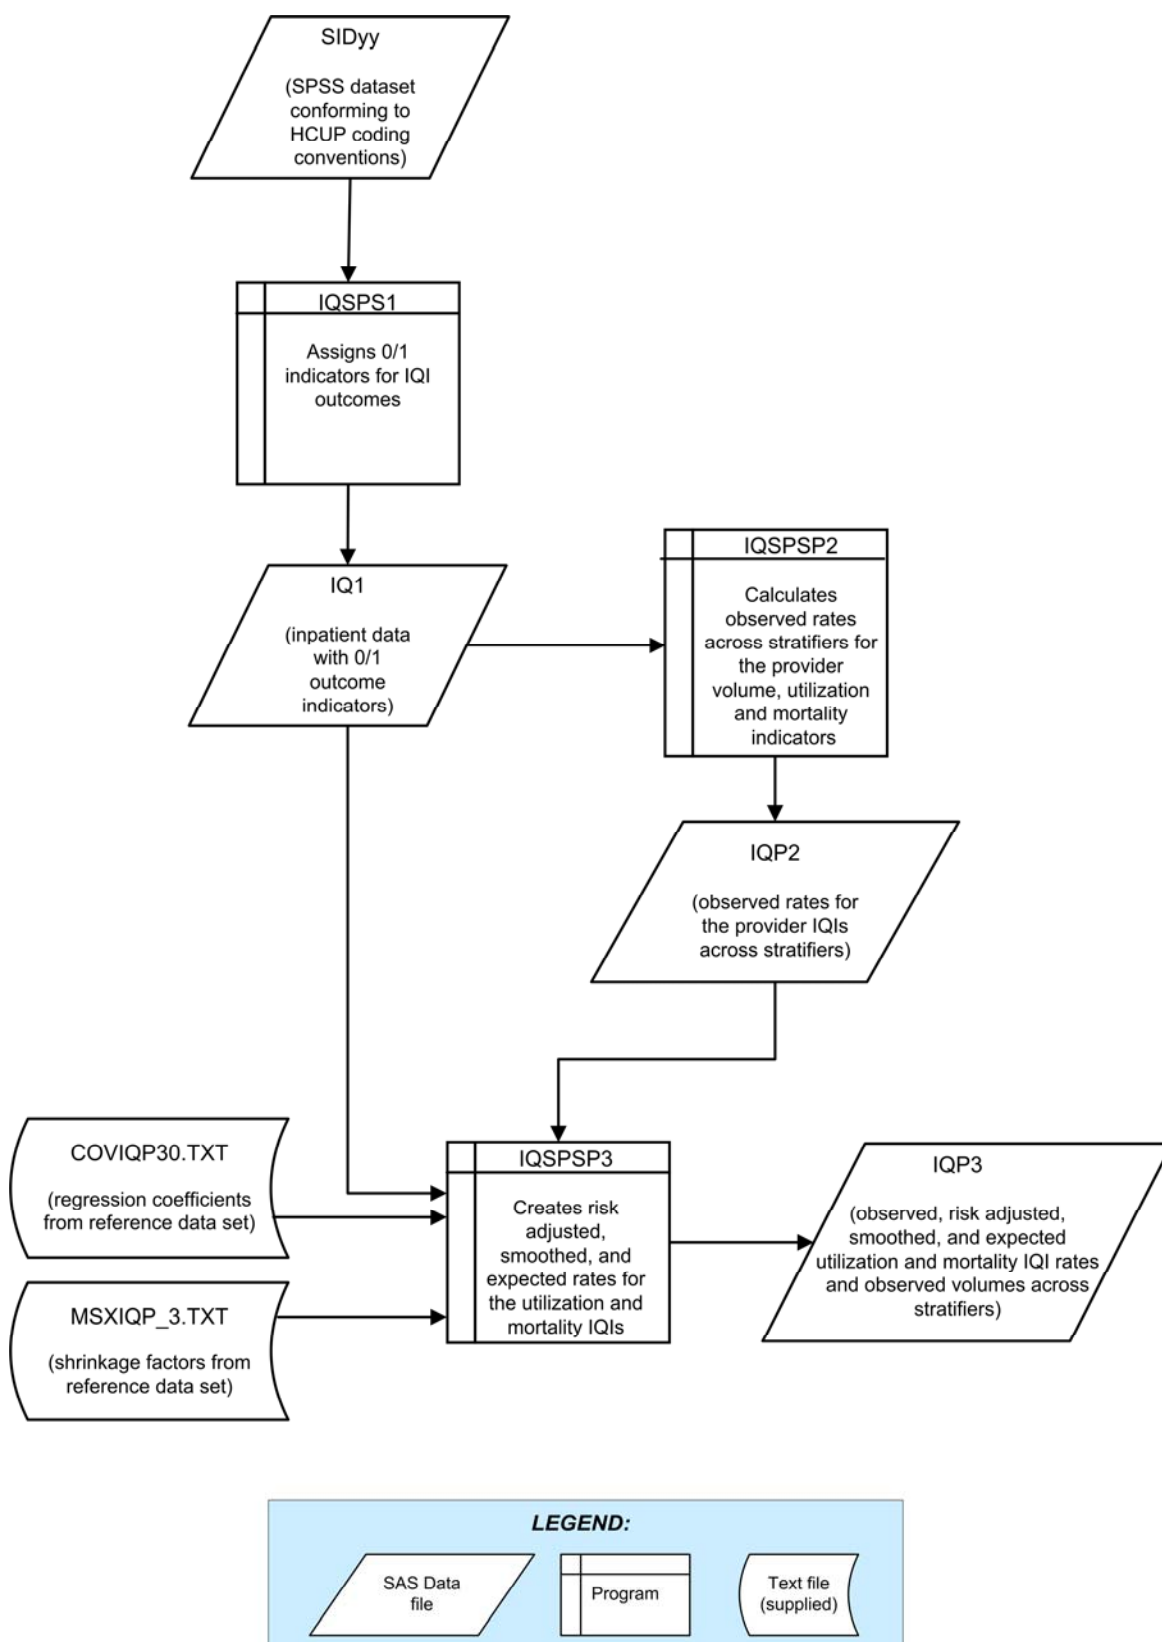

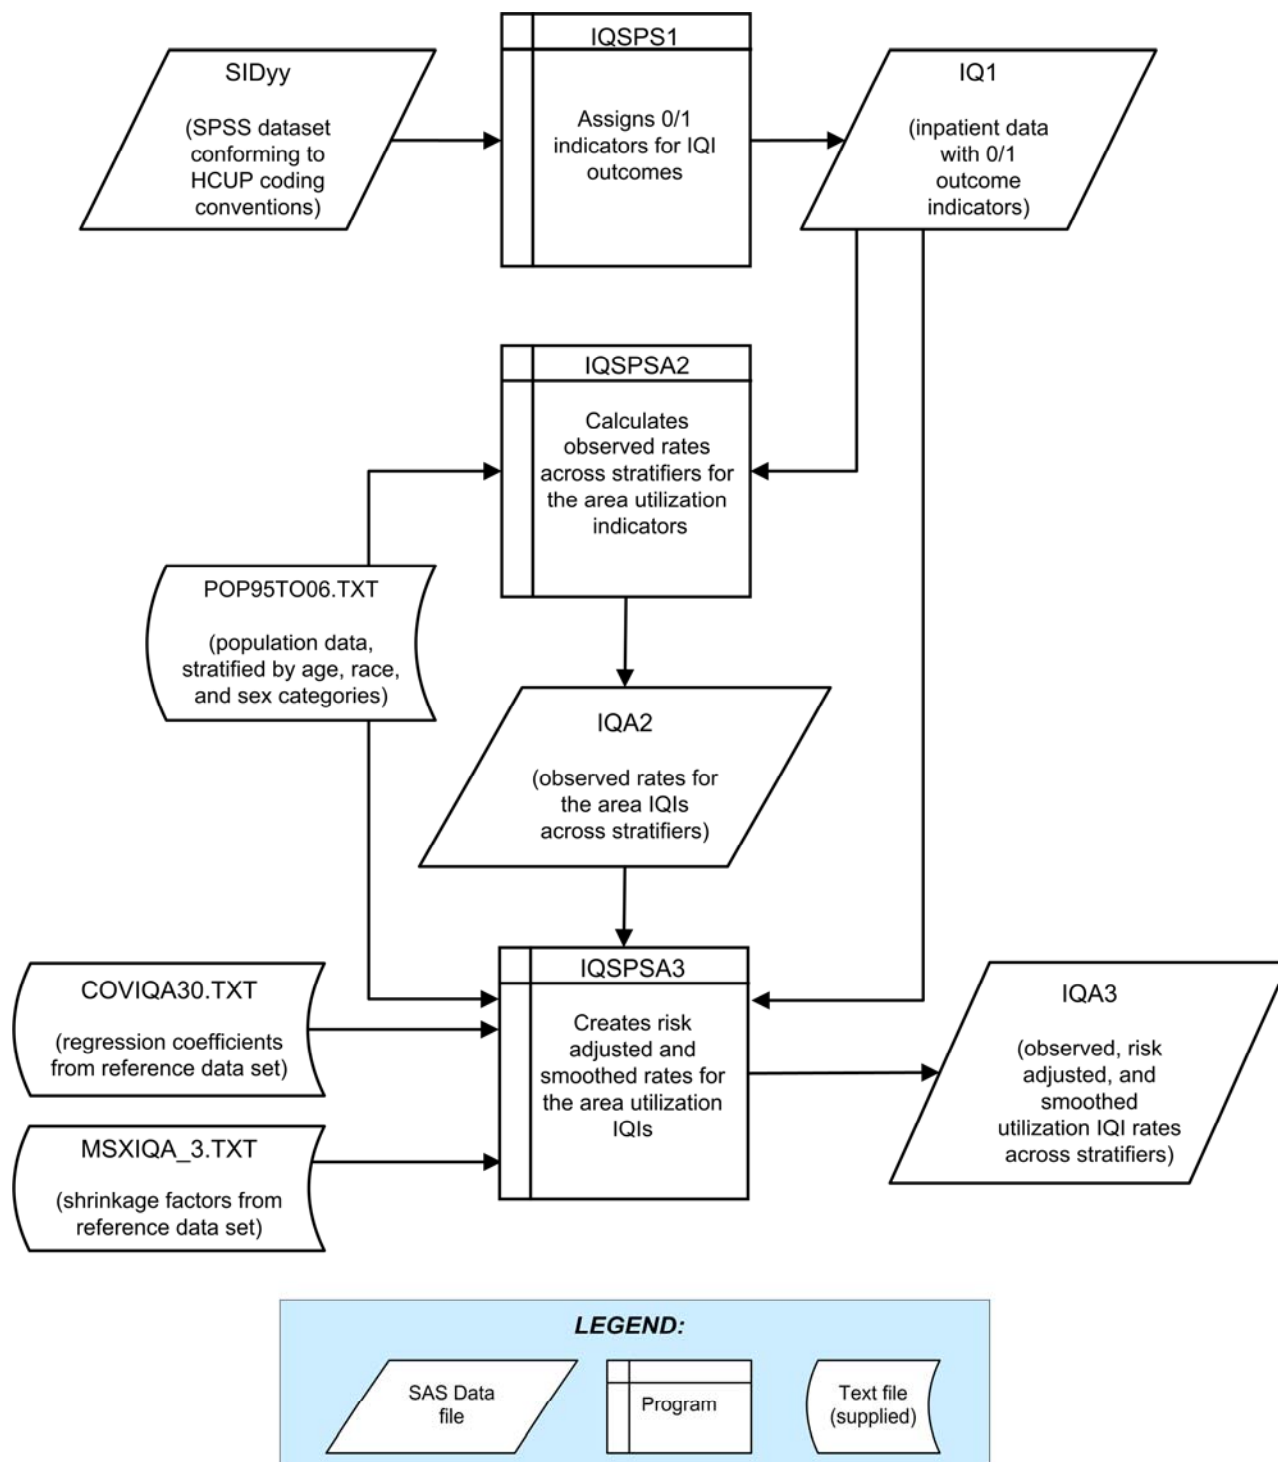

Figure 2. Processing Steps for the Inpatient Quality Area Indicators

3.2 Inpatient Quality Indicator Module Details

Table 1. Inpatient Quality Indicator (IQI) Variables

Type		IQI number	Indicator	Age categories		
				18 to 39	40 to 64	65 +
Provider	Volumes	1	Esophageal resection			
		2	Pancreatic resection			
		4	AAA repair			
		5	CABG	No		
		6	PTCA ^a	No		
		7	Carotid endarterectomy			
	Post-procedural mortality Rates	8	Esophageal resection			
		9	Pancreatic resection			
		11	AAA repair			
		12	CABG	No		
		30	PTCA ^b	No		
		31	Carotid endarterectomy ^b			
		13	Craniotomy			
		14	Hip replacement			
	In-Hospital Mortality rates	15	AMI			
		32	AMI, Without Transfer Cases			
		16	CHF			
		17	Stroke			
		18	GI hemorrhage			
		19	Hip fracture			
		20	Pneumonia			
	Utilization rates	21	Cesarean delivery			
		33	Primary Cesarean delivery			
		22	VBAC (Vaginal Birth After Cesarean), Uncomplicated			
		34	VBAC, All			
		23	Laparoscopic Cholecystectomy			
		24	Incidental appendectomy among elderly	No	No	
		25	Bi-lateral cardiac catheterization			
Area	Utilization rates	26	CABG	No		
		27	PTCA	No		
		28	Hysterectomy			
		29	Laminectomy			

^a PTCA = percutaneous transluminal coronary angioplasty

^b PTCA and carotid endarterectomy mortality are not recommended as stand-alone indicators, but are suggested as companion measures to the corresponding volume measures.

Two of the original IQIs have been moved to the Pediatric Quality Indicators module, and many have been revised to exclude patients under the age of 18. All IQIs now apply only to adult populations.

Table 2. Prefixes for the Inpatient Quality Indicator (IQI) Variables

Prefix	Contents	EXAMPLES	
		Provider Indicator # 8, Esophageal resection	Area Indicator # 26, CABG utilization
T	Inpatient numerator (top)	TPIQ08	TAIQ26
P	Population denominator (pop)	PPIQ08	PAIQ26
O	Observed rate (not applicable to IQI #1-7)	OPIQ08	OAIQ26
R	Risk-adjusted rate (not applicable to IQI #1-7)	RPIQ08	RAIQ26
S	Smoothed rate (not applicable to IQI #1-7)	SPIQ08	SAIQ26
E	Expected Rate (not applicable to IQI #1-7)	EPIQ08	N/A

Table 3. Inpatient Quality Module Contents

SPS programs	ASCII text files
IQSPS1.SPS	COVIQA30.TXT
IQSPSP2.SPS	COVIQP30.TXT
IQSPSP3.SPS	MSXIQP_3.TXT
IQSPSA2.SPS	MSXIQA_3.TXT
IQSPSA3.SPS	POP95TO06.TXT

The ASCII text files are data files provided with the Inpatient Quality module and are necessary for the programs to run. There is no need to convert these files to SPSS format for use with the software.

The parameter reference files of MSXIQP_3.TXT and MSXIQA_3.TXT are not interchangeable between SAS and SPSS software. Users should verify they are running the software with the ASCII text files as listed in Table 3 of the applicable, e.g., SAS or SPSS, software manuals.

4.0 Background

The Inpatient Quality Indicator module contains 30 indicators that reflect the quality of care inside hospitals. Two of the mortality indicators—indicators 30 and 31—are computed by the software but are recommended for use only with the corresponding volume measures (these two IQIs increase the total number of indicators generated by the software to 32). These indicators serve as flags for potential quality problems rather than definitive measures of quality of care. The indicators include three groups of measures based on hospital stays.

1. There are six **Volume** indicators for inpatient procedures for which there is evidence that a higher volume of procedures is associated with lower mortality. A nontrivial number of these procedures are performed by institutions that do not meet recommended volume thresholds. Information about these thresholds and their sources in the literature are given in the *Guide to Inpatient Quality Indicators* (see [Appendix A](#).) The volume indicators are measured as counts of admissions in which particular procedures were performed.
2. There are 13 Inpatient **Mortality** indicators for medical conditions and surgical procedures that have been shown to have mortality rates that vary substantially across institutions and for which evidence suggests that high mortality may be associated with deficiencies in the quality of care. These indicators are measured as rates, the number of deaths divided by the number of admissions for the procedure or condition. Two additional mortality indicators—IQI #30 PTCA and IQI #31 carotid endarterectomy—are computed but are recommended to be used only with the corresponding volume measures (for an overall total of 15 mortality indicators).

Eight of these mortality indicators are for procedures, six of which are also measured by a volume indicator.

The other seven mortality indicators are associated with medical conditions, most of which (except for GI bleeding and pneumonia) are highly concentrated on older patients 50 years of age or older. Hip fracture is more common among elderly women.

3. There are eleven **Utilization** indicators for procedures for which there are questions of overuse, underuse, or misuse. The procedures being examined are ones whose use varies significantly across hospitals and areas, and for which high or low rates of use are likely to represent inappropriate or inefficient delivery of care, leading to worse outcomes, higher costs, or both. These indicators are measured as rates, such as # of C-sections per births in a hospital, # of laparoscopic cholecystectomy per admissions with cholecystectomy.

Seven of the utilization indicators are rates based on the hospitalized population. Four other utilization indicators are rates based on an area's residential population. Two of these area utilization indicators (for CABG and PTCA) have counterparts in the set of volume indicators.

For the four area-based utilization indicators, geographic areas can be defined at the user's option in one of four ways:

- County level with U.S. Census FIPS
- County level with modified FIPS
- Metro Area with OMB 1999 definition
- Metro Area with OMB 2003 definition.

The !MSALEVL parameter has been renamed to !MALEVL to reflect the change in OMB definitions for areas. Refer to page 9 for information on these area definitions and !MALEVL parameter settings.

The indicators in the IQI module are listed in Table 1 on page 5. See also the *Guide to Inpatient Quality Indicators* for the definition of each indicator.

The data required for measuring these indicators come from hospital discharge abstracts or billing claims (administrative data) which are readily available within hospitals or from many state data organizations. The residential population data for the four area-based utilization indicators are from the U.S. Census Bureau.

The software generates observed, risk-adjusted, and smoothed rates for all but the volume indicators. It also generates expected rates for provider indicators. Observed rates are the raw rates. Risk-adjusted and expected rates are derived from applying the average casemix of a baseline file that reflects a large proportion of the U.S. hospitalized or residential population. Smoothed rates are estimates with removal of fluctuations over time due to random variation.

5.0 Data Elements and Coding Conventions

5.1 Input for the AHRQ Quality Indicators

The IQI software was written to process data from discharge data abstracts that contain information about hospital stays. The specific data elements that are needed for the IQI software are listed in Table 4. The IQI module was tested on data from the AHRQ Healthcare Cost and Utilization Project (HCUP). HCUP is an ongoing Federal-State-private collaboration to build uniform databases from administrative hospital-based data collected by State data organizations and hospital associations.

The input data files for the Inpatient Quality Indicators software must be in SPSS.

It is strongly recommended that users recode data elements in their input files to be consistent with the coding expected by the software. This will minimize the number of internal changes that will be necessary in the IQI software. For example, recoding the SEX data element in the input file to be consistent with the coding described in Table 4 (i.e., 1 for male and 2 for female) is easier than modifying all uses of the Sex data element in the IQI programs.

Not every value for every data element is referenced by the IQI software. For example, only two of the discharge disposition (DISP) data element values are used in the software (DISP value “2” for short-term hospital and value “20” for died in the hospital). However, the complete set of standardized values is included, based on HCUP specifications, to assist users of the uniform HCUP data files.

To minimize internal changes to the software, all required elements should be present in the input data file. If a required element is not available, a dummy element should be provided. Failure to provide a dummy element will result in errors during the execution of the IQI programs.

The data elements listed in Table 4 are those required for the input files of **all** the SAS and SPSS QI modules. When a variable is not required for the program the notation “Not used by the IQI program” will be present in the Comments column. The SAS program will still run if these variables are not present, however, the SPSS program will not run correctly. Standardizing the variables and data values in the input data file will be helpful for users who have access to both statistical software packages as well as users working to standardize their input file specifications for use with any of the AHRQ QI software modules.

The data element HOSPSTCO has been renamed to PSTCO to emphasize the importance of calculating area IQIs by the location of the patient residence. If the user wants to calculate the area IQIs using the population associated with the hospital location as the denominator, the values for this variable should be the individual hospital FIPS² state/county codes. If the user wants to calculate the area IQIs based on the population of the Metro area or county associated with the patient residence, the values for this variable should be the FIPS state/county code associated with each individual patient’s place of residence.

² Federal Information Processing Standard, as defined by the U.S. Department of Commerce, National Institute of Standards and Technology (formerly National Bureau of Standards).

If the hospital FIPS code is used in PSTCO, users should be aware that rates may be biased for hospitals which serve as regional referral centers. These hospitals are likely to treat patients from outside the Metro Area, county or even the state in which the facility is located.

Users no longer have to use the Modified FIPS codes assignment for area denominators. However, that option is still available. In the modified FIPS codes certain independent cities (Baltimore City, Carson City and St. Louis City), and areas within Hawaii and Virginia, are assigned to different area groupings in the Modified FIPS categories.

Using the patient FIPS state/county code for analysis may more accurately reflect the true population at risk. Using the hospital FIPS state/county code for analysis should be done with caution, and at larger levels of geographic area (i.e. Metro Area) to minimize the bias with patients that come from a different county than the hospital location.

It is possible that some records in the input data file may be missing the patient FIPS code. Users should be aware that any records with missing values (in the PSTCO data field) are excluded from the calculations of observed, risk-adjusted and smoothed IQI area rates. They will be included in the output from the first program (IQSPS1.SPS).

The software will generate area IQI rates for each county included in the PSTCO data field. Users are encouraged to limit cases in their input file to those patients discharged from the geographic area of interest. For example, if you are using data from the state of Wisconsin and are interested in generating a rate for Wisconsin, you should remove the cases where the patient's county of residence (FIPS code) is from another state. Otherwise the total or overall rate will include the population at risk from the counties outside Wisconsin.

The software provides the user with the option of producing output by Metro Area or by county. When Metro Area is selected, urban areas are always defined by Metro Areas. When county is selected urban areas will be defined by county. Rural areas are always defined by county.

In the software programs, the !MALEVL parameter should be set as follows:

- 0-County level with U.S. Census FIPS*
- 1-County level with modified FIPS*
- 2-Metro Area with OMB 1999 definition*
- 3-Metro Area with OMB 2003 definition.*

The metropolitan area definitions are from three different sources. 1) The "modified FIPS" definition is from the Area Resource File. The mapping is from county to modified FIPS county (e.g., Baltimore city to Baltimore county); 2) The "1999 OMB" definition is from the federal Office of Management and Budget (OMB) circular 99-04, (Last Revised May 6, 2002). The mapping is from county to Metropolitan Statistical Area (MSA), except in New England where counties are assigned to NECMAs (New England County Metropolitan Area). OMB defines NECMAs as a county-based alternative to the city- and town-based New England MSAs and CMSAs (Consolidated MSAs). For example, Hampden and Hampshire counties in Western Massachusetts are assigned to the Springfield MA NECMA, even though Holland town in Hampden County is part of the Boston MSA; and 3) the "2003 OMB" definition is from the federal Office of Management and Budget (OMB) circular 03-04, (Last Revised December 4, 2005). The mapping is from county to either Metropolitan Statistical Area or Micropolitan Statistical Area.

5.2 Coding of Diagnoses, Procedures, and DRGs

Diagnoses and procedures must be coded using the International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM).

Significant modifications to ICD-9-CM codes occurred in the early 1990s. IQI definitions only reflect codes valid after October 1, 1994, and therefore may not accurately analyze data collected before October 1994.

- Diagnoses and procedure codes should be in character strings.
- Diagnosis and procedure codes should not contain any decimal points.
- Diagnosis and procedure codes should be left justified. Diagnosis codes with fewer than five digits should be padded with spaces (not zeros) on the right. Procedure codes with fewer than four digits should be padded with spaces (not zeros) on the right.

The IQI programs assume accurate and specific coding of ICD codes. If an ICD code is specified using 5 digits, the software recognizes only 5-digit versions of that code and not versions truncated at 3 or 4 digits. Similarly, if an ICD code is specified using 4 digits, the software recognizes on 4-digit versions of that code and not versions truncated at 3 digits. For example, 4281 is the ICD-9-CM diagnosis code for left heart failure. If your data are coded less specifically (i.e., 428 is used to designate "heart failure"), these less specific codes are not recognized by the software and will result in undercounting cases.

- This software has ICD-9-CM codes updated through FY 2006 changes.
- Diagnosis-related groups (DRGs) are those derived from the Centers for Medicare & Medicaid Services (previously Health Care Financing Administration) Medicare grouper. The software expects that you will be using the DRG effective on the discharge date. The software now refers to data elements DRG and MDC. Your data should be coded accordingly. The software may be modified at the user's option to use other types of DRGs. However, the impact of using other types of DRGs should be evaluated carefully before making such a change.

Version 3.0 of the software accounts for ICD-9-CM and DRG coding effective through FY2006 (or through September 30, 2006).

5.3 APR-DRG Variables

It is recommended that users run version 20 of 3M's APR-DRG software on their patient data before running the IQI programs in order to create APR-DRG categories, and associated severity and mortality data elements. These APR-DRG variables are used to enhance the risk-adjustment of selected IQI provider indicators.

*APR-DRG software is **not** provided as part of the SPSS version of the IQI software. It must be obtained separately from 3M Health Information Systems.³*

*Users who wish to use APR-DRG results to risk-adjust the provider IQI rates should run their APR-DRG software on their patient data **before** running the IQI programs.*

*Users not using the APR-DRG variables in the risk adjustment should leave these variables off the input dataset and set the !apr parameter to 'none' on program 3 (**!let !apr=none.**)*

Both the SAS IQI software and the AHRQ QI Windows Application include a limited-license version of the APR-DRGs.

³ The APR-DRG software can be licensed from 3M Health Information Systems (3M HIS). 3M HIS makes APR-DRG software available for use with the AHRQ Quality Indicators at a discounted price. 3M HIS can be contacted by calling 1-800-367-2447. When calling, indicate that you are interested in the AHRQ APR-DRG Version 20 product. The APR-DRG Definitions Manual can also be licensed without licensing the APR-DRG software.

5.4 Patient Year and Quarter of Discharge Variables

The patient's year of discharge (YEAR) and quarter of discharge (DQTR) may be used optionally to modify the denominator definition of the stroke mortality indicator (IQI #17) for discharges occurring in FY2005 or later (after September 30, 2004) by excluding the ICD-9-CM diagnosis code 436 "ACUTE BUT ILL-DEFINED CEREBROVASCULAR DISEASE" due to a change in the coding guidelines for that code. If data elements YEAR and DQTR are not present in the user's input data or if the user chooses not to use this option, ICD-9-CM diagnosis code 436 is retained in the denominator population, resulting in the potential inclusion of cases that ought to be excluded in the denominator of IQI #17, Stroke Mortality.

Table 4. Data Elements and Coding Conventions

Variable name	Description	Format	Value description	Comments
KEY	Sequence number. Unique case identifier.	Numeric	User defined unique numeric identifier for each discharge record.	Not used by the IQI programs but should be present to facilitate possible data exploration; allows user to link the records from the IQSPS1.SPS program output file back to the original input data file.
AGE	Age in years at admission	Numeric	Age in years	If this data element is missing the discharge record will be excluded from the analysis.
AGEDAY	Age in days (coded only when the age in years is less than 1)	Numeric	Age in days	If this data element is missing, the value is treated as if it was less than 30 days.
RACE	Race of patient.	Numeric 1 2 3 4 5 6	White Black Hispanic Asian or Pacific Island Native American Other	The values of 1, 2, and 3 are used directly in the IQI software. All other ethnicity codes are mapped to an 'other' category.
SEX	Sex of patient	Numeric 1 2	Male Female	If this data element is missing the discharge record will be excluded from the analysis.
PAY1	Expected primary payer	Numeric 1 2 3 4 5 6	Medicare Medicaid Private, incl. HMO Self-pay No charge Other	The values of 1, 2, 3, and 4 are used directly in the IQI software. All other payer codes are mapped to an 'other' category. This data element is used to stratify only the Provider-level IQIs (IQI01-IQI25, IQI30-IQI34).
PSTCO	Location of patient residence or hospital location (FIPS [†] State/county code)	Numeric Scccc	Modified Federal Information Processing Standards State/county code	See Appendix A for link to list of most recent codes. If this data element is missing the discharge record will be excluded from rate calculations.
HOSPID	Data Source hospital number	Numeric	Hospital identification number	
DISP	Disposition of patient	Numeric 1 2 3	Routine Short-term hospital Skilled nursing facility	The values 2 and 20 are referenced by the IQI code (to identify transfers to another short-term hospital, and

Variable name	Description	Format	Value description	Comments
		4 5 6 7 20	Intermediate care Another type of facility Home health care Against medical advice Died in the hospital	patients who died in the hospital).
ATYPE	Admission Type	Numeric 1 2 3 4 5 6	Emergency Urgent Elective Newborn Trauma Center ⁴ Other	Not used by the IQI program. If not present in the input data file it is not necessary to create a dummy variable.
ASOURCE	Admission Source	Numeric 1 2 3 4 5	ER Another hospital Another facility incl LTC Court/law enforcement Routine/birth/other	The value 2 is referenced by the IQI code (to identify transfers from another short-term hospital).
LOS	Length of Stay	Numeric	Number of days from admission to discharge	Not used by the IQI program. If not present in the input data file it is not necessary to create a dummy variable.
APR_DRG	APR-DRG category	Numeric	APR-DRG from 3M software.	This is an optional but recommended variable that can be obtained by first running the input discharge dataset through version 20 of the APR-DRG software (3M Health Information Systems). See Table 7. How to Set up IQI Software Parameters for Using APR-DRG Variables for Risk-Adjustment on page 23.
SEVERTY	APR-DRG Severity Score	Numeric	APR-DRG Severity Score from 3M software.	See Table 7 on page 23.
RISKMORT	APR-DRG Mortality Score	Numeric	APR-DRG Risk of Mortality Score from 3M Software.	See Table 7 on page 23
DRG	Diagnosis Related Group	Numeric	DRG from federal (CMS) DRG Grouper. DRG in effect on discharge date.	
MDC	Major Diagnostic Category	Numeric	MDC from federal (CMS) DRG grouper. MDC in effect on discharge date.	
DX1 – DX30	ICD-9-CM diagnosis codes. DX1 is the principal diagnosis, DX2-DX30 are secondary diagnoses.	String, 5 character each	Diagnosis codes	Users must specify the number of diagnosis variables as the parameter in the IQSPS1.SPS program (!maxdx).
NDX	Count of the number of diagnoses (DX) on the discharge record	Numeric	Count of diagnoses (principal and all secondary diagnoses)	If the 1 st discharge record has 5 Dx and the 2 nd has 10, NDX would be 5 on the 1 st and 10 on the 2 nd . (This variable is

⁴ The ATYPE value "5" was used to indicate delivery only in the 1988 to 1997 HCUP data files. The UB standards currently use "5" to indicate Trauma Center.

Variable name	Description	Format	Value description	Comments
				not used in the SAS program.)
PR1 – PR30	ICD-9-CM procedure codes. PR1 is the principal procedure, PR2-PR30 are secondary procedures..	String, 4 character each	Procedure codes	Users must specify the number of procedure variables as the parameter in the IQSPS1.SPS program (IMAXPR).
NPR	Count of the number of procedures (PR) on the discharge record	Numeric	Count of procedures (principal and all secondary procedures)	If the 1 st discharge record has 1 Pr and the 2 nd has 2, NPR would be 1 for the 1 st record and 2 for the 2 nd . (This variable is not used in the SAS program.)
PRDAY1 – PRDAY30	Days from admission to procedure. PR1 is the principal procedure, PR2-PR30 are secondary procedures.	Numeric	Days from Admission to Procedure	Not used by the IQI program. If not present in the input data file it is not necessary to create a dummy variable.
YEAR	Year of discharge. The patient's year of discharge. For example, a patient discharged on July 7, 2004 would have a discharge year of '2004.'	Numeric	YYYY Discharge year should be within the range of 1997 to 2005.	Optional data element. If present and the user wishes to exclude cases with ICD-9 code 436 who were discharged after Sept. 30, 2004 from the denominator population of IQI 17 (stroke mortality), the !YEARQTR flag should be set to "yes" (!YEARQTR='yes').
DQTR	Quarter of discharge. The calendar quarter of the patient's discharge. For example, a patient discharged on July 7, 2004 would have a discharge quarter of '3.'	Numeric	1 January-March 2 April-June 3 July-September 4 October-December	Optional – see note under Year above.
	AHRQ comorbidity variables			Required if Risk-Adjusted PSI rates are desired.

†Federal Information Processing Standard, as defined by the U.S. Department of Commerce, National Institute of Standards and Technology (formerly National Bureau of Standards).

Note: Certain independent cities (Baltimore City, Carson City and St. Louis City), and areas within Hawaii and Virginia, are assigned to different area groupings in the Modified FIPS categories as compared to the US Census Dept. groupings. The AHRQ QI software uses the Modified FIPS code assignment of these areas. Failure to use the Modified FIPS codes assignment will result in the use of incorrect denominator estimates for area indicators.

5.5 Missing Values

The IQI programs do not distinguish among different types of missing values.

Data files of hospital discharge abstract data may have numeric data elements coded using special SPSS missing values. For example, besides the standard SPSS value of "." for missing data, there might also be present values of -1 for invalid data, -2 for data unavailable from a particular source, -3 for inconsistent data. However, the IQI programs do **not** distinguish among the different types of missing codes. Therefore, all types of missing values in the input data to the IQI module can be represented by a single value - missing data (.) for numeric variables and blank (' ') for alphanumeric (or character) variables.

5.6 Treatment of Missing Data

The software is designed to handle missing data in a particular manner; specifically the software requires confirmation for the assignment of a poor outcome or negative event. For instance, in order to be assigned as a death, each case must actually be coded as a death. Missing data is considered neutral. Missing data for some elements results in the exclusion of that case from the denominator. For a few other elements, the case is retained. Table 5 lists the impact of missing data for each data element and impact on the processing of the individual patient record.

Table 5. Treatment of Missing Data Elements

Variable	Label	D	N	E	S	Treatment of Missing Data
AGE	Age In Years At Admission	X	X		X	Case excluded from all analysis (e.g., dropped from the denominator of the discharge based indicators and from numerator of all population based measures).
AGEDAY	Age in days (coded only when the age in years is less than 1)	X				The value is treated as if it was less than 30 days.
ASOURCE	Admission Source			X		Case excluded from denominator where used in specification (e.g., IQI 32).
DISP	Disposition Status		X	X		Case excluded from denominator where used in specification (e.g., IQI 15).
DRG	Diagnosis Related Group (CMS DRG) in Effect on Discharge Date	X	X			Case excluded from denominator (e.g., IQI 13) and from numerator (e.g., IQI 24) where used in specification.
Sex	Patient Gender	X	X		X	Case excluded from all analysis (e.g., dropped from the denominator of the discharge based indicators and from numerator of all population based measures).
PSTCO	Location of Patient Residence or Hospital Location Modified FIPS State/County Code	X				Dropped from denominator in rate calculations (stratified by county or MSA), case will appear in calculation of the overall rate.
MDC	Major Diagnostic Category (CMS MDC) In Effect On Discharge Date	X				Case excluded from denominator (e.g., IQI 01) where used in specification.
RACE	Race				X	Classified As "Other".

D – Denominator; N – Numerator; E – Exclusion; S – Stratification

6.0 User Options

The IQI software reflects the development and implementation of the software with discharge data available to AHRQ through the HCUP program. Our goal was to develop the tools, illustrate their use, and then encourage others to adopt and use the tools for their own applications. As a result, users are encouraged to consider how AHRQ may modify or enhance the IQI software to better serve their measurement needs and interests.

Modifications to the definitions of outcomes of interest (numerators) or populations at risk are possible but not recommended. Maintaining consistent definitions is important. Once definitions are altered, the ability to make comparisons of IQIs based on original definitions is lost. Users are encouraged to identify ways to improve the IQI methodology and to share their suggestions with AHRQ for future updates. Suggestions and comments can be shared by sending to the QI user support e-mail address at support@qualityindicators.ahrq.gov. Your input into the IQI methodology and software is welcomed.

In the near future, AHRQ will be providing national estimates using the IQIs through its web-based query system, HCUPnet (<http://hcup.ahrq.gov/HCUPnet.asp>). If users change definitions of the IQIs, it will not be possible to compare users' results to the national estimates in HCUPnet.

7.0 Producing Inpatient Quality Indicator Rates - Processing Steps

Each Inpatient Quality Indicator (IQI) expressed as a rate, is simply defined as:

Outcome of interest / Population at risk

[or]

Numerator / Denominator

Conceptually, five steps are necessary to produce the IQI rates. The following describes the steps and how the software performs them.

7.1 Step 1. Identify outcomes in inpatient records

Inpatient records are marked to indicate whether they contain the outcome of interest (numerator or “top”) for each of the AHRQ IQI measures.

This is done by setting a series of flag variables, each of which corresponds to the numerator for a particular IQI. For example, if the inpatient record meets the conditions for inclusion in the outcome for IQI #1, then the outcome indicator for IQI #1 is set to one.

This step requires one pass through the discharge-level data and outputs a discharge-level data file containing the flag indicator variables for the outcomes for each IQI. This output file also contains the original input variables, with the exception of the diagnosis and procedure variables which have been removed to reduce the size of the output file.

The first six Inpatient Quality Indicators are volume measures, and for these QIs this first step is all that is necessary. The remaining steps two through five are relevant for the remaining indicators which are rates as opposed to total volume measures.

7.2 Step 2. Identify populations at risk

For the Provider IQIs, the populations at risk (the denominators for calculating the IQI rates, or “pop”) are derived from the hospital discharge records.

For the four Area IQIs, the populations at risk (the denominators for calculating the IQI rates) are derived from Census population figures.

7.3 Step 3. Calculate observed (raw) Inpatient Quality Indicator rates

Using the output data from step 1 and either hospital discharge or U.S. Census population data from step 2, the IQI rates are calculated for user-specified combinations of stratifiers. These stratifiers include hospitals, age groups, race/ethnicity categories, sex, and payer categories for the Provider IQIs, and areas (Metro Areas/counties), age groups, race/ethnicity categories, and sex for the Area IQIs.

The programs calculate observed IQI rates regardless of the number of cases available. However, IQI rates based on only a few cases should be interpreted with caution.

In performance measurement work, it is recommended that rates be suppressed when there are fewer than 30 cases in the denominator. This exclusion rule serves two purposes:

- It eliminates unstable estimates based on too few cases.

- It helps protect the identities of hospitals and patients.

This step outputs the observed rates for user-specified categories, alone or in combination. For example, Provider IQI observed rates could be output at the hospital level, at the payer level, or at the hospital level by payer.

7.4 Step 4. Risk adjust the Inpatient Quality Indicator rates

Overall file means and regression coefficients from a baseline database (reflecting a large proportion of the U.S. population) are applied to the observed rates in the risk-adjustment process. These baseline file means and regression coefficients are provided as part of the IQI module. The risk-adjusted rates will then reflect the age and sex distribution (and the APR DRG distribution for the provider indicators) of data in the baseline file rather than the distribution for the hospitals or areas present in the users' data. This will allow risk-adjusted rates produced by various users to be compared directly to one another. The overall means and regression coefficients were derived from HCUP's Year 2003 State Inpatient Data (SID) for 38 states. The code to generate these baseline means and coefficients are not part of the IQI module.

For the provider indicators, if there are fewer than three discharges for the particular IQI for a particular combination of stratifiers, then the risk-adjusted rate for that combination of stratifiers is set to missing.

7.5 Step 5. Create MSX smoothed rates

Shrinkage factors are applied to the risk-adjusted rates for each IQI in a process called multivariate signal extraction (MSX). These shrinkage factors were calculated from the HCUP Year 2003 SID database of 38 states. For each IQI, the shrinkage estimate reflects a 'reliability adjustment' unique to each indicator. The less reliable the IQI over time and across hospitals or areas, the more the estimate 'shrinks' the IQI toward the overall area mean. The resulting rate will appear "smoother" than the raw rate, meaning the year-to-year fluctuations in performance are likely to be reduced. More information on interpreting smoothed rates is contained in the interpretation section of this document. The shrinkage factors are provided as part of the IQI software and do not need to be calculated by users.

These five steps reflect the IQI module production in a nutshell. The next section of this document describes the specifics of each software component of the IQI module software.

8.0 Program Descriptions

This section describes the five SPSS programs that assign, calculate, and print the Inpatient Quality Indicators.

For each program there is a description, a list of input and output files, and an explanation of changes to the program that may be required. The flow of data through the IQI module programs is shown in the flowcharts in Figures 1 and 2 that begin on page 3.

If you desire to create and examine observed IQI rates, then the IQSPS1 program will need to be used, followed by IQSPSP2 (for Provider observed rates and volume indicators) and/or IQSPSA2 (for Area observed rates). If you also wish to create risk-adjusted and smoothed IQI rates, then you will also need to run the IQSPSP3 and/or the IQSPSA3 program.

8.1 Program 1: Run IQSPS1.SPS

The IQSPS1 program processes hospital discharge abstract data and flags inpatient records if they contain outcomes of interest. Outcome indicator names, or numerators, have prefix of "T" (T_{op}). Stratifier variables are constructed at the beginning of the program.

This program assumes that the input data file (consisting of inpatient discharge abstract data) conforms to specific variable names, attributes, and coding conventions. See Table 4 on page 11 for variable names and attributes for the input data file.

Partial definitions of the Inpatient Quality Indicators are given in Table 1 on page 5. This table is presented to assist those individuals who desire to examine the software source code statements. Complete definitions of the indicators are given in *Inpatient Quality Indicators Technical Specifications*. This information was formerly in Appendix A of the *Guide to Inpatient Quality Indicators*.

Input:

1. User supplied SPSS inpatient data set consisting of administrative hospital discharge abstract data. This data set is a discharge level file with an array of diagnosis and procedure codes, among other data elements.

Output:

1. SPSS dataset containing inpatient records with input variables, stratifiers, and flag indicators (TPIQxx and TAIQxx) for the outcomes of interest that will later form the numerators for the IQI rates.
2. DESCRIPTIVE statistics (with N, MIN, MAX, MEAN, and SUM) of all of the numeric variables in the output data file.

Changes:

1. The !TEMPDIR parameter specifies the name of a directory the program will use to store temporary datasets while the program is executing. Once the program completes the datasets in this directory can be safely deleted
2. The !PERMDIR parameter specifies the name of a directory the program will use to keep permanent datasets. The input dataset must be saved in this location.
3. The !TEXTDIR parameter specifies the name of the directory where all AHRQ-supplied text files have been saved. These text files should not be converted to SPSS datasets
4. !MALEVL should indicate whether Metro Area codes should be created from the county codes (PSTCO) on the input dataset. Refer to Page 9 for a list of values for the !MALEVL parameter. Specifying !MALEVL value does not affect the input PSTCO codes, so users still have the

option of analyzing data at a different level in the 2nd and 3rd program no matter how this parameter is specified in this first program.

5. The !INDATA parameter specifies the name of the input dataset of hospital discharge records to be processed. It must be located in the directory specified by the !PERMDIR parameter.
6. The !OUTDATA parameter specifies the name of the output SPSS dataset which contain the IQI flags.
7. The !MAXDX specifies the number of diagnosis variables on the hospital discharge records to be processed.
8. The !MAXPR specifies the number of procedure variables on the hospital discharge records to be processed.
9. The !YEARQTR parameter specifies whether the input data file contains the variables Year and DQTR (patient year and quarter of discharge). If the input data includes these data elements and the user wishes to exclude cases with ICD-9 code 436 from the denominator population of IQI 17 (stroke mortality), the !YEARQTR flag should be set to "yes" (!YEARQTR='yes'). If the data elements are not present or if the user wants to include patients with the ICD-9 code 436 (valid through October 1, 2004) in the denominator population, the !YEARQTR flag should be set to "no" (!YEARQTR='no').

8.2 Program 2: Run IQSPSP2.SPS

For all but the volume indicators (IQIs 01-07), the IQSPSP2 program calculates the observed or raw rates for the provider-level Inpatient Quality Indicators, using the data derived in a previous step (IQSPS1). These observed rates are stratified by combinations of providers, sex, age, race, and payer categories. The program first totals the indicator flags created by the IQSPS1 program and then for each of the desired stratifiers divides these totals by the hospital discharges in the universe for the indicator. The population denominators are stored in variables with names that have a prefix of "P" (Pop). The Observed rates are stored in variables that have a prefix of "O".

Input:

1. The SPSS dataset that was created in the IQSPS1. This is a discharge-level file that contains inpatient records with input variables, stratifiers, and the 30 new flag indicators for the IQI Provider outcomes of interest.

Output:

1. SPSS dataset with summary records that contain observed rates (OPIQxx variables where xx refers to the indicator number), the counts of outcomes that formed the numerators of the rates (TPIQxx variables), and the hospital discharge totals that formed the denominators of the observed rates (PPIQxx variables). The output file has records summarized to the various combinations of stratifiers specified in the !STRLEVS parameter that is described in item 6 in the "Changes" section below. Note that the observed rates and the denominator totals are not generated for the Provider volume indicators (IQIs 01-07).
2. DESCRIPTIVE statistics (with N, MIN, MAX, MEAN, and SUM) of the provider-level summary records that shows statistics for the OPIQxx observed rates, the TPIQxx counts of outcomes that formed the numerators of the rates, and the PPIQxx counts of outcomes that formed the denominators of the rates. These means will only be generated if the user included a value of 16 for the !STRLEVS parameter discussed in item 6 in the "Changes" section below.
3. Optional LISTING of the output summary dataset is provided at the end of the hardcopy printout. This printout may be quite large depending on the number and the types of stratifications that the user requests with the !STRLEVS parameter discussed in item 6 in the

“Changes” section below. If the user does not wish to generate this printout, then the parameter !PRINT should be set to ‘no’.

Changes:

1. The !TEMPDIR parameter specifies the name of a directory the program will use to store temporary datasets while the program is executing. Once the program completes the datasets in this directory can be safely deleted.

A pathname must end with the character "\" as shown in the example below:

```
!!let !tempdir = 'c:\IQI\'
```

2. The !PERMDIR parameter specifies the name of a directory the program will use to keep permanent datasets. The input dataset must be saved in this location.
3. The !INDATA parameter specifies the name of the input dataset of hospital discharge records output from program IQSPS1. It must be located in the directory specified by the !PERMDIR parameter.
4. The !OUTDATA parameter specifies the name of the output SPSS dataset which contain the observed rates.
5. The !PRINT parameter specifies whether the records in the final dataset should be printed. Possible values are yes or no.
6. The !STRLEVS parameter specifies all the cross classifications among age category, sex, race category and provider for which rates should be calculated. The values should be specified as a list enclosed by quotes, e.g. '16 17', to specify provider and provider by race, respectively. Table 6 shows the possible values for !STRLEVS.

Table 6. IQSPSP2 Aggregation Choices

!STRLEVS	Stratification
0	Overall
1	Race
2	Payer
3	Payer * Race
4	Sex
5	Sex * Race
6	Sex * Payer
7	Sex * Payer * Race
8	Age
9	Age * Race
10	Age * Payer
11	Age * Payer * Race
12	Age * Sex
13	Age * Sex * Race
14	Age * Sex * Payer
15	Age * Sex * Payer * Race

!STRLEVS	Stratification					
20	Provider	*	Sex			
21	Provider	*	Sex	*		Race
22	Provider	*	Sex	*	Payer	
23	Provider	*	Sex	*	Payer	* Race
24	Provider	*	Age			
25	Provider	*	Age	*		Race
26	Provider	*	Age	*	Payer	
27	Provider	*	Age	*	Payer	* Race
28	Provider	*	Age	*	Sex	
29	Provider	*	Age	*	Sex	* Race
30	Provider	*	Age	*	Sex	* Payer
31	Provider	*	Age	*	Sex	* Payer * Race

16 TYPELVLP (overall and provider) is the default value for the level of computation in the software.

For example, if you are using a state inpatient hospital database, you might specify the following !STRLEVS values:

- 8 – provides overall rates for your state, broken down by age groups
- 16 – provides rates for providers within your state
- 24 – provides rates for age groups within these providers

8.3 Program 3: Run IQSPSP3.SPS

The IQSPSP3 program calculates risk-adjusted rates by patient age, sex and APR-DRG (if available) for each IQI and then calculates smoothed rates. The risk-adjusted and smoothed rates are not calculated for the Provider volume indicators, IQIs 01-07, just as observed rates were not calculated for these indicators.

When there are fewer than three discharges within a stratification cell, the risk-adjusted and expected rates are set to missing. The smoothed rates that are based on these risk-adjusted rates are also set to missing.

The output file has records summarized to the various combinations of stratifiers that were specified in the !STRLEVS parameter of the preceding IQSPSP2 program. See Table 6 on page 20.

Input:

1. The discharge-level file that was created by the IQSPS1 program.
2. The SPSS dataset with summary records that was created with the IQSPSP2 program.
3. A text file (COVIQP30.TXT) containing regression coefficients from a regression that was run on a reference SID dataset. These coefficients will be used in the risk adjustment process. This file is provided to you as part of the IQI module. The text file does not need to be converted to a SPSS file for use with the software.
4. A text file (MSXIQP_3.TXT) containing three arrays for use in the smoothing process. The arrays contain noise estimates, signal estimates, and mean area rates for each IQI. This file is provided to you as part of the IQI module. The text file does not need to be converted to a SPSS file for use with the software.

Output:

1. A SPSS dataset with an overall summary record and with provider-level summary records that contain the three types of indicator rates, along with the components of the initial raw rates.

Specifically, the file contains the observed rates (OPIQxx variables), the risk-adjusted rates (RPIQxx variables), the smoothed rates (SPIQxx variables), the expected rates (EPIQxx variables), the counts of outcomes that formed the numerators of the observed rates (TPIQxx variables), and the hospital discharge totals that formed the denominators of the observed rates (PPIQxx variables).

2. DESCRIPTIVE statistics (with N, MIN, MAX, MEAN, and SUM) of the provider-level summary records that shows statistics for the observed, risk-adjusted and smoothed rates, and statistics for the counts of outcomes that formed the numerators and denominators of the observed rates. These means will only be generated if the user included a value of 16 for the !STRLEVS parameter of the IQSPSP2 program. See Table 6 on page 20.
3. Optional LISTING of the output summary dataset is provided at the end of the hardcopy printout. This printout may be quite large depending on the number and the types of stratifications that the user requested with the !STRLEVS parameter of the preceding IQSPSP2 program. See Table 6 on page 20. If the user does not wish to generate this printout, then the !PRINT parameter should be set to no.

Changes:

1. The !TEMPDIR parameter specifies the name of a directory the program will use to store temporary datasets while the program is executing. Once the program completes the datasets in this directory can be safely deleted
2. The !PERMDIR parameter specifies the name of a directory the program will use to keep permanent datasets.
3. The !TEXTDIR parameter specifies the name of the directory where all AHRQ-supplied text files have been saved. These text files should not be converted to SPSS datasets
4. The !INDATA1 parameter specifies the name of the input dataset of hospital discharge records from program IQSPS1. It must be located in the directory specified by the !PERMDIR parameter.
5. The !INDATA2 parameter specifies the name of the dataset produced by IQSPSP2. It must be located in the directory specified by the !PERMDIR parameter.
6. The !OUTDATA parameter specifies the name of the output SPSS dataset with the risk adjusted and smoothed rates. It will be saved to the directory specified by the !PERMDIR parameter.
7. The !STRLEVS parameter specifies all the cross classifications among age category, sex, race category and provider for which rates should be calculated. The values should agree with those specified on the IQSPSP2 program.
8. The !PRINT parameter specifies whether the final dataset's records should be printed or not. The possible values are yes or no.
9. The !COVARP parameter specifies the name of the text file (located within the directory specified by !TEXTDIR) that contains the regression coefficients (COVIQP30.TXT) to risk adjust the observed rates.
10. The !MSX parameter specifies the name of the text file (located within the directory specified by !TEXTDIR) that contains the signal and noise coefficients (MSXIQP_3.TXT) to smooth the risk adjusted rates.
11. The !APR parameter specifies the name of the APR-DRG variable in the input dataset which was output from the 3M APR-DRG software to risk adjust the observed rates. This variable is

not required for the risk adjustment; however, if it is not present, this parameter should be set to the word none. It should not be left blank. See Table 7.

12. The !SEVER parameter specifies the name of the severity score variable in the input dataset which was output from the 3M APR-DRG software to risk adjust the observed rates. This variable is not required for the risk adjustment. If it is not present, the parameter can be left blank. See Table 7.

13. The !MORT parameter specifies the name of the mortality risk variable in the input dataset which was output from the 3M APR-DRG software to risk adjust the observed rates. This variable is not required for the risk adjustment. If it is not present, the parameter can be left blank. See Table 7.

Table 7. How to Set up IQI Software Parameters for Using APR-DRG Variables for Risk-Adjustment

	<i>If you do not intend to risk-adjust the provider indicators</i>	<i>If you are going to run IQISASP3 to risk adjust the provider indicators:</i>	
		<i>If you have APR-DRG software available</i>	<i>If you do not have APR-DRG software available</i>
Preliminary data processing	None	Process your input data file through the APR-DRG software to create APR-DRGs, and associated mortality and severity data elements before running any of the IQI software.	None
Setting the APR, SEVER, and MORT parameters in IQSPSP3.SPS	No action required.	Set to APR_DRG, SEVERTY and RISKMORT.	APR parameter - Set to equal 'none' (without quotes) SEVER and MORT parameters – Leave blank

8.4 Program 4: Run IQSPSA2.SPS

The IQSPSA2 program calculates the observed or raw rates for the area-level Inpatient Quality Indicators, using the data derived in a previous step (IQSPS1). These observed rates can be stratified by combinations of area, sex, age, and race categories. The program first totals the four area indicator flags created by the IQSPS1 program, and then for each of the desired stratifiers divides these totals by the pertinent residential population. The population denominators are stored in variables with names that have a prefix of "P" (Pop). The Observed rates are stored in variables that have a prefix of "O".

Input:

1. The SPSS dataset that was created by the IQSPS1 program. This is a discharge-level file that contains inpatient records with input variables, stratifiers, and the four new flag indicators for the IQI Area outcomes of interest.
2. A text file with Census area residential populations, stratified by area, age, sex, and ethnicity categories. One such file is currently provided along with the IQI module software. The file is POP95TO06.TXT

The User should select the year (POPYEAR) that best matches the user's discharge data file.

Output:

1. SPSS dataset with summary records that contain observed rates (OAIQxx variables where xx refers to the indicator number), the counts of outcomes that formed the numerators of the rates (TAIQxx variables), and the residential population totals that formed the denominators of the observed rates (PAIQxx variables). The output file has records summarized to the various combinations of stratifiers specified in the !STRLEVS parameter that is described in item 7 in the “Changes” section below.
2. DESCRIPTIVE statistics (with N, MIN, MAX, MEAN, and SUM) of the area-level summary records that shows statistics for the OAIQxx observed rates, the TAIQxx counts of outcomes that formed the numerators of the rates, and the PAIQxx residential populations totals. These means will only be generated if the user included a value of 8 for the !STRLEVS parameter discussed in item 7 in the “Changes” section below.
3. Optional LISTING of the output summary dataset is provided at the end of the hardcopy printout. This printout may be quite large depending on the number and the types of stratifications that the user requests with the !STRLEVS parameter discussed in item 7 in the “Changes” section below. If the user does not wish to generate this printout, then the !PRINT parameter to NO or no.

Changes:

1. The !TEMPDIR parameter specifies the name of a directory the program will use to store temporary datasets while the program is executing. Once the program completes the datasets in this directory can be safely deleted.
2. The !PERMDIR parameter specifies the name of a directory the program will use to keep permanent datasets. The input dataset must be saved in this location.
3. The !TEXTDIR parameter specifies the name of the directory where all AHRQ-supplied text files have been saved. These text files should not be converted to SPSS datasets.
4. The !INDATA parameter specifies the name of the input dataset of hospital discharge records output from the IQSPS1 program. It must be located in the directory specified by the !PERMDIR parameter.
5. The !OUTDATA parameter specifies the name of the output SPSS dataset which contain the observed rates. It will be saved in the directory specified by the !PERMDIR parameter.
6. !POPYEAR should specify the year that best matches the user’s discharge data file.
7. !MALEVL should indicate whether observed rates should be constructed at the county level for all areas of the county (the default) or whether rates in urban areas should be constructed at the Metro Area level. See page 9 for a list of values for the !MALEVL parameter..

WARNING: The specification of !MALEVL must be consistent between programs 2 and 3.

8. The !STRLEVS parameter specifies all the cross classifications among age category, sex, race category and area for which rates should be calculated. The values should be specified as a list enclosed by quotes, eg '8 10', to specify area and area by sex, respectively. Table 8 shows the possible values for !STRLEVS.

WARNING: STRLEVS must include the value 8 (area) if you wish to subsequently run program IQPSA3 for risk-adjusted and smoothed rates.

Table 8. IQSPSA2 Aggregation Choices

STRLEVS	Stratification
0	Overall
1	Race
2	Sex
3	Sex * Race
4	Age
5	Age * Race
6	Age * Sex
7	Age * Sex * Race
8	Area
9	Area * Race
10	Area * Sex
11	Area * Sex * Race
12	Area * Age
13	Area * Age * Race
14	Area * Age * Sex
15	Area * Age * Sex * Race

- ! STRLEVS=0 (Overall) is calculated automatically.
- ! Area will be defined differently depending on the specification of the !MALEVL Parameter. See page 9 for a list of values for the !MALEVL parameter.
- ! STRLEVS must include the value 8 to subsequently run program 3.

The !PRINT parameter should indicate whether the final dataset should be listed or not. If !PRINT is set to 'yes', then the program will generate a listing for each of the 16 indicators, including the numerator, denominator and observed rate for each level of stratification specified by the !STRLEVS parameter. If the user does not want to generate this listing, the !PRINT parameter should be set to 'no'.

8.5 Program 5: Run IQSPSA3.SPS

The IQSPSA3 program calculates age and sex risk-adjusted rates for each area-based IQI (overall rates and rates by area), and then calculates smoothed rates.

Input:

1. The discharge-level file that was created with the IQSPS1 program.
2. The SPSS dataset with summary records that was created with the IQSPSA2 program.
3. A text file with Census area residential populations, stratified by area, age, sex, and ethnicity categories. One such file is currently provided along with the IQI module software. The file is POP95TO06.

The user should select the year (!POPYEAR) that best matches the user's discharge data.

4. A text file (COVIQA30.TXT) containing regression coefficients from a regression that was run on the reference SID dataset. These coefficients will be used in the risk adjustment process. This file is provided to you as part of the IQI module. The text file does not need to be converted to a SPS file for use with the software.

5. A text file (MSXIQ_3.TXT) containing three arrays for use in the smoothing process. The arrays contain noise estimates, signal estimates, and mean area rates for each IQI. This file is provided to you as part of the IQI module. The text file does not need to be converted to a SPSS file for use with the software.

Output:

1. A SPSS dataset with an overall summary record and with area-level summary records that contain the three types of indicator rates, along with the components of the initial raw rates. Specifically, the file contains the observed rates (OAIQxx variables), the risk-adjusted rates (RAIQxx variables), the smoothed rates (SAIQxx variables), the counts of outcomes that formed the numerators of the observed rates (TAIQxx variables), and the residential population totals that formed the denominators of the observed rates (PAIQxx variables).
2. DESCRIPTIVE statistics (with N, MIN, MAX, MEAN, and SUM) of the area-level summary records that shows statistics for the OAIQxx observed rates and their TAIQxx and PAIQxx components, the RAIQxx risk-adjusted rates, and the SAIQxx smoothed rates.
3. Optional LISTING of the output summary dataset is provided at the end of the hardcopy printout. If the user does not wish to generate this printout, then the global !PRINT parameter should be set to no.

Changes:

1. The !TEMPDIR parameter specifies the name of a directory the program will use to store temporary datasets while the program is executing. Once the program completes the datasets in this directory can be safely deleted.
2. The !PERMDIR parameter specifies the name of a directory the program will use to keep permanent datasets. The input dataset must be saved in this location.
3. The !TEXTDIR parameter specifies the name of the directory where all AHRQ-supplied text files have been saved. These text files should not be converted to SPSS datasets.
4. The !POPYEAR parameter should specify the year that best matches the user's discharge data.
5. !MALEVL should indicate whether rates for urban counties should be calculated at the Metro Area rather than the county level. See page 9 for a list of !MALEVL option settings.

WARNING: The specification of !MALEVL must be consistent between programs 2 and 3.

6. The !INDATA1 parameter specifies the name of the input dataset of hospital discharge records from program IQSPS1. It must be located in the directory specified by the !PERMDIR parameter.
7. The !INDATA2 parameter specifies the name of the dataset produced by IQSPSA2. It must be located in the directory specified by the !PERMDIR parameter.
8. The !OUTDATA parameter specifies the name of the output SPSS dataset with the risk adjusted and smoothed rates. It will be saved in the directory specified by the !PERMDIR parameter.
9. The !COVARA parameter specifies the name of the text file (located within the directory specified by !TEXTDIR) that contains the regression coefficients (COVIQA30.TXT) to risk adjust the observed rates.
10. The !MSX parameter specifies the name of the text file (located within the directory specified by !TEXTDIR) that contains the signal and noise coefficients (MSXIQ_3.TXT) to smooth the risk adjusted rates.

9.0 Reviewing the Printed Output

This section contains tips for reviewing some of the printed output from the IQI module. These tips are oriented toward explaining the interrelationships between printout items from different programs and hopefully will help to reveal the nature and structure of the module outputs. For guidance in interpreting the results, see Using Different Types of QI Rates in the document Guide to Inpatient Quality Indicators, available at http://www.qualityindicators.ahrq.gov/iqi_download.htm.

The final output of the IQI module is a LISTING from IQSPSP3 (for provider-level indicators) and IQSPSA3 (for area-level indicators). All interim printouts are for checking and trouble-shooting. However, if you have elected to refrain from risk-adjusting and smoothing the data, then the final outputs will be the LISTING at the end of the IQSPSP2 and/or IQSPSA2 programs.

9.1 IQSPS1

The initial printout from the IQSPS1 program contains DESCRIPTIVES for all of the numeric variables in the output discharge-level dataset. It will contain information for the newly constructed TAIQxx and TPIQxx flag variables that will later form the numerators for the indicator rates. For each TAIQxx and TPIQxx flag variable:

- The SUM will contain the total number of observations in the dataset that were found to have the particular outcome of interest.
- For the seven Provider volume indicators (TPIQ01-TPIQ07) and the four Area indicators (TAIQ26-TAIQ29), the MEAN, MINIMUM, and MAXIMUM will usually be the value one since the flag variables have either been set to missing (‘.’) or to a value of one. The remainder of the Provider indicators (TPIQ08-TPIQ25, and TPIQ30-TPIQ34) have a value of one, zero, or missing (‘.’). For these indicators, a value of zero was assigned to the TPIQxx flag if a particular observation was part of the population at risk for a particular indicator but did not have the particular outcome of interest. So for example, TPIQ21 = 1 indicates a patient who had a Cesarean delivery, while TPIQ21 = 0 identifies a patient who had a delivery but not a Cesarean.
- For the Provider indicators TPIQ08-TPIQ25 and TPIQ30-TPIQ34, the MEANs will contain a close approximation of the eventual overall observed indicator rates. The values will change slightly after IQSPSP2 has applied additional parts of the indicator definitions.
- N lists the number of observations in the dataset with non-missing values. For the seven provider-based volume indicators and the four area-based indicators, N for TPIQxx or TAIQxx will be the same as the SUM. For the other provider-based indicators, N will contain the denominator for the observed indicator rate. Note: the N's or denominators for seven of the mortality indicators (# 8-12, 30, and 31) will be similar to the Ns and SUMs for the seven volume indicators (TPIQ01-TPIQ07), but often they will not be exactly identical since the mortality indicators exclude discharges that were transferred to other hospitals.

9.2 IQSPSP2

The purpose of this printout is to provide the observed rates for all provider-level indicators. The default printout shows results by provider, but other levels of output (as shown in Table 6) can be specified as well. Note that risk-adjusted and smoothed rates are shown in the output from the next program.

The printout from the IQSPSP2 program contains DESCRIPTIVES on the provider-level summary records for all of the numeric variables in the output summary dataset. It will contain information for the newly constructed OPIQxx rates, the PPIQxx denominators, and the TPIQxx numerators.

- The STRAT variable described in the MEANS table identifies the stratification level for the records in the output data set. The STRAT variable corresponds to the !STRLEVS parameter values that were specified (see item 6 in the “Changes” section for the IQSPSP2 program on page 20). In this case, STRAT always assumes the value of 16, since only the provider-level records are selected.
- The N statistic for STRAT contains the number of providers in the output summary data set. A TPIQxx numerator variable with a value for N that is lower than the N value for STRAT indicates that there were no outcomes of interest for some of the providers. Similarly, a PPIQxx denominator variable with a lower value for N than STRAT indicates that for some providers, there were no hospital discharges with the outcome of interest.
- The MINIMUM value for the TPIQ08-TPIQ25, TPIQ30-TPIQ34 numerators will usually be zero since values of zero were assigned for observations that were part of the population for the rate denominator but did not have the particular outcome of interest to be included in the rate numerator. For the volume indicators, (TPIQ01-TPIQ07), the MINIMUM value will be one or higher.

*For the observed rates, the User should **NOT** report the MEANS displayed here, but instead should refer to the overall means in the output dataset that are also present in the subsequent LISTING. The MEANS given here are means of hospital means; i.e., all hospitals are given equal weight, regardless of the number of discharges in the different hospitals.*

- The SUMs for the counter variables TPIQxx and PPIQxx will contain overall file totals for these data elements. The SUMs for the observed rates have no intuitive meaning.

If the !PRINT parameter is set to yes, the subsequent LISTING output contains a complete dump of the output summary file. Listed for each record are the stratification values, the PPIQxx population denominators for the 27 provider indicators, the TPIQxx outcome numerators for the 30 provider indicators, and the 30 OPIQxx observed rates.

9.3 IQSPSP3

The LISTING at the end of this program provides your **final output**. (This printout appears if the !PRINT parameter is set to yes.) It lists the numerator and the denominator, along with the observed, risk-adjusted, and smoothed rates for all indicators, as shown in the following example.

The following table lists the column headers shown on the printed output and describes each. Each indicator is reported in a separate section. Values of "xx" correspond to the two-digit IQI number.

Table 9. Provider Level Printed Output

Column Heading	Description
Obs	Observation number.
HOSPID	Identifier for each provider in the dataset.
AGECAT	Age stratification category - See Table 6 for TYPELVLP settings.
SEXCAT	Gender stratification category - See Table 6 for TYPELVLP settings.
PAYCAT	Payer stratification category - See Table 6 for TYPELVLP settings.
RACECAT	Race stratification category - See Table 6 for TYPELVLP settings.
TPIQxx	Number of cases in the numerator.
PPIQxx	Number of cases in the denominator (population at risk).
OPIQxx	Observed (raw) rate - Numerator divided by Denominator.
RPIQxx	Risk-adjusted rate - Accounts for the difference between the case-mix of the reference population and the provider's case-mix.
SPIQxx	Smoothed rate - Rates with removal of fluxuation over time.
EPIQxx	Expected rate - Rates the provider would have if it performed the same as the reference population given the provider's actual case-mix (e.g., age, gender, modified DRG and comorbidities)

Observation 1 (with HOSPID = .) is the overall average for the entire dataset (STRAT = 0). The remaining observations are individual providers, or hospitals (STRAT = 16). Data will appear under the column headers, AGECAT, SEXCAT, PAYCAT, and RACECAT, if you specify these levels of aggregation (shown in Table 6).

You may wish to express the results in more understandable terms:

- Multiply the utilization rates by 100 to express them as a percentage (e.g., $0.2040 * 100 = 20.4\%$ C-section rate)

The MEANS table is generated from the permanent provider-based output file and is provided for troubleshooting and understanding your data, but not for reporting. The means are provided just for the provider level summary records.

- The N for all but the TPIQxx counter variables should contain the number of providers in the users database.
- The MEANS, MINIMUMs, and MAXIMUMs have their normal meaning and provide comparisons among the different hospitals or providers in your database.

For the (observed, risk-adjusted, or smoothed) rates, the User should **NOT** report the MEANS displayed here, but instead refer to the overall means in the output dataset in the LISTING labeled "FINAL OUTPUT." The MEANS given here are means of hospital means; i.e., all hospitals are given equal weight, regardless of the number of discharges in the different hospitals.

- Note: The denominators for seven of the mortality indicators (# 8 - 12, 30 & 31) will be similar to the totals for the six volume indicators (TPIQ01-TPIQ07), but often they will not be exactly identical since the mortality indicators exclude discharges that were transferred to other hospitals.
- Note: Smoothed rates are not computed for two indicators: #8 esophageal resection mortality and #31 carotid endarterectomy mortality. These events are so infrequent that our analyses could not detect enough systematic provider level variation to compute the smoothed rates.
- If the !PRINT parameter is set to yes, at the end of the printout is a LISTING on the final provider-based output file. Listed for each level of stratification are the stratifiers, the numerator and denominator totals for the observed rates, and the observed, risk-adjusted, and smoothed rates.

9.4 IQSPSA2

The purpose of this printout is to provide the observed rates for all area-level indicators. The default printout shows overall results and results by area, but other levels of output (as shown in Table 8) can be specified as well. Note that risk-adjusted and smoothed rates are shown in the output from the next program.

The printout from the IQSPSA2 program contains DESCRIPTIVES for all of the numeric variables in the output summary dataset. It will contain information for the newly constructed OAIQxx rates, the PAIQxx denominators, and the TAIQxx numerators.

- The STRAT variable described in the first row of the MEANS table identifies the stratification level for the records in the output data set. The STRAT variable corresponds to the !STRLEVS parameter values that were specified (see item 8 in the [“Changes”](#) section for the IQSPSA2 program on page 24). In this case, STRAT always assumes the value of 8, since only the area-level records are selected.
- The N statistic for STRAT contains the number of areas in the output summary data set. A TAIQxx numerator variable with a lower value for N than STRAT indicates that there were no outcomes of interest for some of the areas.
- The MINIMUM value for the TAIQxx numerators will be one or higher.

*For the observed rates, the User should **NOT** report the MEANS displayed here, but instead should refer to the overall means in the output dataset that are also present in the subsequent LISTING. The MEANS given here are means of the area means; i.e., all areas are given equal weight, regardless of the population in the different areas.*

- The SUMs for the counter variables TAIQxx and PAIQXX will contain overall file totals for these data elements. The SUMs for the observed rates have no intuitive meaning.

If the !PRINT parameter is set to yes, the subsequent LISTING output contains a complete dump of the output summary file. Listed for each record are the stratification values, the PAIQxx population denominators for the four indicators, the TAIQxx outcome numerators for the four indicators, and the four OAIQxx observed rates.

9.5 IQSPSA3

The LISTING at the end of this program provides your **final output**. (This printout appears if the !PRINT parameter is set to yes.) It lists the numerator and the denominator, along with the observed, risk-adjusted, smoothed, and expected rates for all indicators.

The following table lists the column headers shown on the printed output and describes each. Each indicator is reported in a separate section. Values of "xx" correspond to the two-digit IQI number.

Table 10. Area Level Printed Output

Column Heading	Description
Obs	Observation 1 is the overall average for the entire dataset (TYPELVLA = 0). The remaining observations are individual areas (TYPELVLA = 8).
Area	Identifier in the dataset for area.
TAIQxx	Number of cases in the numerator.
PAIQxx	Number of cases in the denominator (population at risk).
OAIQxx	Observed (raw) rate - Numerator divided by Denominator.
RPIQxx	Risk-adjusted rate - Accounts for the difference between the case-mix of the reference population and the area's case-mix.
SPIQxx	Smoothed rate - Rates with removal of fluxuation over time.

You may wish to express the results in more understandable terms:

- Multiply the utilization rates by 100,000 to express them as a rate per 100,000 population (e.g., $0.0012 * 100,000 = 120$ hysterectomies per 100,000 population).

The MEANS table is generated from the permanent area-based output file. The means are provided just for the area-level summary records.

- The N for all but the TAIQxx counter variables should contain the number of different areas (MSAs and counties) in your database.
- The MEANS, MINIMUMs, and MAXIMUMs have their normal meaning and provide comparisons among the different areas in your database. Note that the MAXIMUMs for the counter variables (the TAIQxx and PAIQxx variables) are associated with specific areas, and therefore these MAXIMUMs may not match those in the prior IQSPS2 printouts since that run typically will include a record for the entire database.

For the (observed, risk-adjusted, or smoothed) rates, the User should **NOT** report the MEANS displayed here, but instead refer to the overall means in the output dataset that are also present in the subsequent LISTING. The MEANS given here are means of area means; i.e., all areas are given equal weight, regardless of the number of discharges in the different areas.

- The SUMs of the counter variables (the TAIQxx and PAIQxx variables) yield the overall database totals.

10.0 Benchmark Timings

The benchmark runtimes given below are from runs made on a Windows XP workstation, with a Pentium 4 CPU 2.80 GHz processor, 512 MB of RAM, and an IDE hard drive. The dataset used contained 757,624 observations with 15 diagnosis fields and 15 procedure fields.

Step	Run time (in seconds)
Run IQSPS1	245
Run IQSPSP2	69
Run IQSPSP3	697
Run IQSPSA2	55
Run IQSPSA3	212

11.0 User Support

Technical assistance is available, through an electronic user support system monitored by the QI support team, to support users in their application of the IQI software. The same e-mail address may be used to communicate to AHRQ any suggestions for IQI enhancements, general questions, and any QI related comments you may have. AHRQ welcomes your feedback.

The Internet address for user support and feedback is: support@qualityindicators.ahrq.gov

AHRQ also offers a listserv to keep you informed on the Quality Indicators (QIs). The listserv is used to announce any QI changes or updates, new tools and resources, and to distribute other QI related information. This is a free service. Simply follow the process described below to begin receiving important QI information. All you need is a computer, Internet access, and an E-mail address. It works just like other electronic distribution lists

Here's how to register:

1. Send an E-mail message to: listserv@qualityindicators.ahrq.gov.
2. On the subject line, type: Subscribe. For example:

Subscribe

3. In the body of the message type: sub Quality_Indicators-L and your full name. For example:

sub Quality_Indicators-L John Doe

4. You will receive a message confirming that you are signed up.

If you have any questions, contact AHRQ QI Support at the e-mail noted above. You should receive an automatic response e-mail message confirming receipt of your e-mail. If you do not receive a confirmation message, call (888) 512-6090.

Appendix A: Links

The following links may be helpful to users of the AHRQ Inpatient Quality Indicators.

Inpatient Quality Indicators Version 3.0 Documents and Software

Available at http://www.qualityindicators.ahrq.gov/igi_download.htm

Title	Description
<i>Guide to Inpatient Quality Indicators</i>	Describes how the IQIs were developed and provides detailed evidence for each indicator.
<i>Inpatient Quality Indicators Technical Specifications</i>	Provides detailed definitions of each IQI, including all ICD-9-CM and DRG codes that are included in or excluded from the numerator and denominator. Note that exclusions from the denominator are automatically applied to the numerator.
<i>IQI Covariates used in Risk Adjustment</i>	Tables for each IQI provide the stratification and coefficients used to calculate the risk-adjusted rate for each strata.
<i>SAS® IQI Software Documentation</i>	This software documentation provides detailed instructions on how to use the SAS ® version of the IQI software including data preparation, calculation of the IQI rates, and interpretation of output.
<i>SPSS® IQI Software Documentation</i>	This software documentation provides detailed instructions on how to use the SPSS® version of the IQI software including data preparation, calculation of the IQI rates, and interpretation of output.
<i>Change Log to IQI Documents and Software</i>	The Change Log document provides a cumulative summary of all changes to the IQI software, software documentation, and other documents made since the release of version 2.1 of the software in March 2003. Changes to indicator specifications that were not a result of new ICD-9-CM and DRG codes, are also described in the Change Log.
<i>Fiscal year 2006 Coding Changes</i>	This document summarizes the changes to the indicator definitions resulting from FY 2006 changes to ICD-9-CM coding and DRG changes. These changes will only affect data from FY 2006 (October 1, 2005) or later.
SAS® IQI Software	Requires the SAS® statistical program distributed by the SAS Institute, Inc. The company may be contacted directly regarding the licensing of its products: http://www.sas.com
3M® APR® DRG Limited License Grouper for SAS®	Creates APR-DRG variables for use with SAS version of IQI software. Instructions for running the software are included in the Zip file.
SPSS® IQI Software	Requires the SPSS® statistical program distributed by SPSS, Inc. The company may be contacted directly regarding the licensing of its products: http://www.spss.com

AHRQ QI Windows Application

The AHRQ QI Windows Application calculates rates for all of the AHRQ Quality Indicators modules and does not require either SAS® or SPSS®. It is available at:

http://www.qualityindicators.ahrq.gov/winqi_download.htm

Additional Documents

The following documents are available within the "Documentation" section of the **AHRQ QI Downloads** Web page:

<http://www.qualityindicators.ahrq.gov/downloads.htm>

- *Refinement of the HCUP Quality Indicators (Technical Review), May 2001*
- *Refinement of the HCUP Quality Indicators (Summary), May 2001*
